Background of the problem:

Many colleges and universities still manage events manually or through scattered systems like notices, WhatsApp groups, or spreadsheets. This leads to issues such as miscommunication, missed registrations, lack of centralized data, and difficulty in tracking participants or event details.

Why this project is important:

It helps automate event creation, registration, notifications, and participant tracking using modern web technologies and database systems. It improves communication and reduces manual workload for organizers.

Real-world relevance:

This system is widely applicable in educational institutions, corporate organizations, and communities where multiple events are conducted regularly. Similar systems are used in universities, tech fests, workshops, seminars, and conference management platforms.

Brief overview of the system:

A responsive web-based application that allows users (students and organizers) to view, register, and manage campus events.

PROBLEM STATEMENT

9

In many educational institutions, campus events such as workshops, seminars, cultural programs, and technical fests are managed using manual methods or disconnected digital tools. This often leads to problems like inefficient communication, difficulty in event registration, data mismanagement, lack of real-time updates, and poor coordination between organizers and participants.

There is a need for a centralized, user-friendly system that can streamline the process of event creation, registration, and management. The system should allow organizers to efficiently manage event details and participants, while enabling students to easily browse events, register, and receive timely updates.

OBJECTIVES

1
2
3
4
5
6
7
8
9

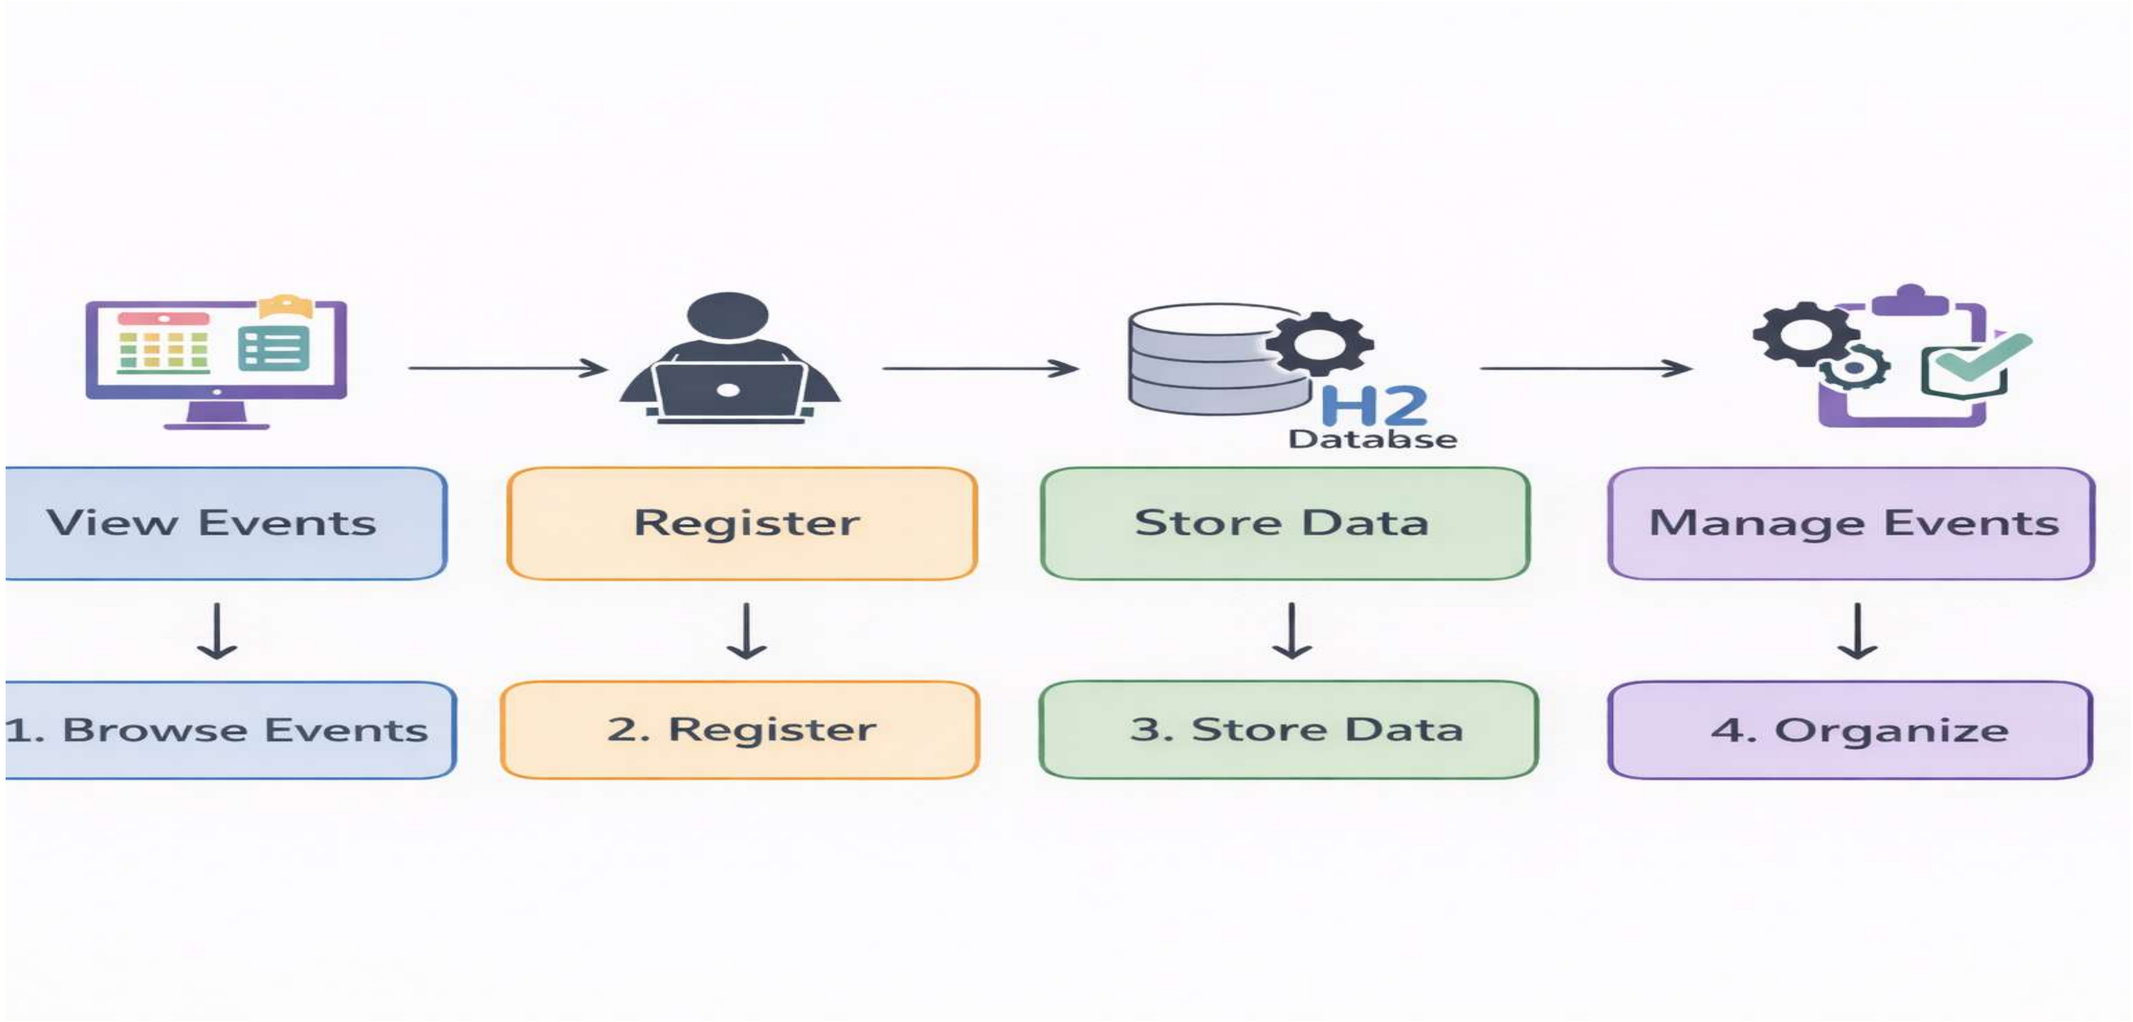
- To design and develop a centralized system for managing events efficiently.
- To provide a user-friendly interface for browsing and registering for events.
- To enable organizers to create, update, and manage event details easily.
- To store and manage event and participant data using H2 Console for quick and lightweight database operations.
- To reduce manual work and improve overall system efficiency.

PROPOSED SYSTEM

1
2
3
4
5
6
7
8
9

- Event management is often handled using manual or scattered systems.
- Users face difficulty in finding and registering for events.
- There is no centralized platform to manage event details efficiently.
- Organizers struggle to track participants and update event information.
- Existing systems do not provide smooth user experience.
- There is a need for a system that ensures efficient event handling.

PROPOSED SYSTEM ARCHITECTURE



WORKFLOW

Frontend:

1.HTML5
2.CSS3
3.Javascript

Backend:

1.Java Spring Boot
2.H2 Console

Tools:

1.Eclipse

Software Requirements:

1.Windows
2. Web Browser

MODULE DESCRIPTION

Module 1: Event Management:

- Display Events Dynamically.
- Organize Events By Category.
- View Event Details.

Module 2: Registration Management:

- Register For Events.
- Cancel Registration.
- View Registered Events.

Module 3: Data Persistence Module:

- Stores Event & User Data in H2 Console.
- Retrieves Data After Refresh.

Module 4: Notification Module:

- Send Confirmation Email After Registration.
- Notify Users About Event Updates.

5
6
7
8
9

Advantages:

- Easy event registration process.
- Data persistence using H2 Database.
- Real-time updates for users.
- Improves coordination and reduces manual work.
- User-friendly and responsive interface.

Limitations:

- Limited scalability for large-scale usage.
- Basic notification system email only.
- Less support for advanced analytics features.
- Data security depends on implementation.

Thank you
